

CMS User Guide

How to use **Sanity Studio** to create and edit services, blog posts, pages, images, and redirects — from login to publish — with troubleshooting.

STUDIO URL

carewellcms.sanity.studio

PUBLIC WEBSITE

www.carewellmedicalcentre.com

AUDIENCE

Editors, clinic staff, SEO

VERSION

2026 · Sanity + Next.js

Tip: After schema updates, hard-refresh Studio (`Ctrl+Shift+R`) so new fields (e.g. Desktop / Mobile hero images) appear.

14. Troubleshooting
15. Quick checklists

1. How the system works

Care Well's public website is **not** edited in WordPress anymore. Content lives in **Sanity CMS**. The Next.js website reads that content and displays it.

End-to-end flow

Leads (contact forms) go to a separate admin at `/admin` on the website — not inside Sanity.

Two “admins” — don’t mix them up

- **Sanity Studio**
= content (services, blogs, images, SEO).
- **Website /admin**
= leads inbox, staff users, Services mega-menu links.

2. Sign in & Studio layout

1. Open <https://carewellcms.sanity.studio>
2. Sign in with the Google / email account invited by your project admin.
3. If you see an empty screen, ask an Administrator to invite you in Sanity Manage → Members.

Left sidebar (Care Well CMS)

Main content

- **Services** — treatment pages (hero, FAQs, pricing...)
- **Blog posts** — articles
- **Pages** — generic CMS pages

Supporting

- **Gallery / Testimonials**
- **Navigation / Site settings**
- **Redirects** — URL moves

Document editor basics

- Click a document in the list to open the form.
- Fields are grouped in tabs (e.g. Hero, Content, SEO) on service pages.
- Bottom / top bar: **Publish**, Discard changes, Review changes.
- Unsaved work shows as a draft — always **Publish** when ready for the live site.

3. Roles & permissions

Role	Typical use	Can do
Administrator	Clinic lead / tech	Everything, invite users, project settings
Editor	Content team	Create / edit / publish services, posts, pages, media
Viewer	Stakeholder	Read only — cannot publish

4. Editing a service page (step by step)

Service pages power treatment URLs such as `/hair-transplant-in-delhi/`.

Critical fields

Field	What it does	Tips
Page title	Main H1 on the website	Write the real patient-facing headline
Slug	Internal ID / fallback path	Generate from title; don't change casually
URI Path	Public URL path	Must match live URL, e.g. <code>/hair-transplant-in-delhi/</code> (leading & trailing slash)
Category	Grouping / filters	hair, skin, surgical, wellness, etc.
SEO group	Title & description for Google	Keep title ~50–60 chars; description ~150–160

Hero tab — what visitors see first

1. **Tagline** — optional subtitle under the H1. Leave blank to hide.
2. **Desktop hero image** — wide image for large screens.
3. **Mobile hero image** — taller crop for phones (optional; falls back to desktop).
4. **Alt text** — required on each image for SEO/accessibility (expand the image field).
5. **Primary / Secondary CTA labels** — button text (e.g. Book Free Consultation / WhatsApp).
6. **Quick facts** — short label/value pairs under the hero.

If you still see a single field named “Hero image”

Schema was updated to “Desktop hero image” + “Mobile hero image”. Hard-refresh Studio (`Ctrl+Shift+R`) or sign out/in. Confirm schema deploy already ran (`npm run sanity:deploy-schema`).

Other important groups (fill as needed)

- **Overview / How it works / Before & after / Candidacy** — medical content sections.
- **Pricing / Booking / Doctor / FAQs / Related** — conversion & trust.

- **Page builder** (if enabled) — section order for the main column.
- Empty sections usually **hide automatically** on the website — leave unused fields blank.

5. Hero images — desktop vs mobile

Upload **two different crops** when possible so faces and text stay in frame on both phone and desktop.

Field in Studio	Recommended size (px)	Minimum	Shape
Desktop hero image	1920 × 900	1600 × 750	Landscape / wide
Mobile hero image	1080 × 1350	750 × 940	Portrait / taller

Upload workflow

- Click **Upload**
(or drag into the dashed box).
- Wait until the thumbnail appears.
- Open the image field → set **Alt text**
(describe the photo, not “image1”).
- Adjust **Hotspot**
if available so the face stays centered when cropped.
- Publish the document.

6. Creating a new service

1. Left sidebar → **Services** → create new.
2. Enter **Page title** (this becomes the H1).
3. Click **Generate** on Slug.
4. Set **URI Path** carefully — this is the public address. Example: `/laser-hair-removal-in-delhi/`
5. Fill Hero (images + CTAs), then other sections you need.
6. Add SEO title/description.
7. **Publish**.
8. Open the live URI on the website. If you changed an old URL, add a **Redirect**.

URI mistakes break Google rankings

Prefer keeping the same URI as the old WordPress page. If you must change it, create a Redirect (old path → new path) before or right after publish.

7. Blog posts

1. Sidebar → **Blog posts** → create or open.
2. Set **Title**, generate **Slug**, set **URI** if used.
3. Add **excerpt**, **main image** (+ alt), categories/tags as available.
4. Write the **Body** with headings (H2/H3), lists, images, embeds.
5. Fill **SEO**.
6. Publish → check under `/blogs/` and the post URL.

Body tips

Use real headings for structure (helps SEO). Compress large photos before upload. Don't paste huge Word tables as screenshots when a simple list will do.

8. Generic pages

Pages in Studio are generic documents. Many marketing pages (Home, About, Contact, Privacy) are **handcrafted in the website code** and may not be fully driven by these Page documents. Prefer editing **Services** and **Blog posts** for day-to-day content.

Ask the development team before creating a new top-level marketing page in Studio if you expect a brand-new public route.

9. Uploading images (best practices)

Use case	Recommended size	Format
Service hero — desktop	1920 × 900 px	JPG / WebP
Service hero — mobile	1080 × 1350 px	JPG / WebP
Blog featured image	1200 × 630 px	JPG / WebP
Before / after pair	800 × 1000 px each (similar crop)	JPG
Doctor / team photo	800 × 1000 px	JPG

- Always add **Alt text**.
- Prefer under ~500 KB when possible (export quality ~70–80%).
- Don't upload screenshots of text — use real text fields for SEO.
- Patient photos: ensure consent; use the consent notice fields where provided.

Image upload path

10. Publishing, drafts & preview

- **Draft** = saved but not live.
- **Publish** = live for the website (after cache refresh — see §13).
- **Unpublish** removes from the public API — use carefully on important URLs.
- Use **Review changes** before publishing large edits.

Preview

If Presentation / preview is configured, you can open a draft preview of the website. Preview requires a valid signed link — random “draft mode” URLs without a secret will fail (by design).

11. Redirects (old URL → new URL)

1. Sidebar → **Redirects** → create.
2. **From:** old path, e.g. `/old-page/`
3. **To:** new path or full URL, e.g. `/new-page/`
4. Mark as permanent (301) when the move is final.
5. Publish.

Redirects are applied by the website middleware. Test in a private browser window.

12. Website admin panel (leads & menu)

Separate from Sanity. Sign in at `https://www.carewellmedicalcentre.com/admin/login/`

Section	Purpose
Leads	Patient form submissions, status, notes, export
Services menu	Edit navbar mega-menu link URLs (persisted in database)
Blogs / Pages	Inventory + deep links into Sanity
Users	Staff logins for this admin (Admin role)
Website content	Shortcuts to edit in Studio

When to use which tool

Use Sanity Studio

- Service copy & FAQs
- Hero photos
- Blog articles
- SEO fields
- URL redirects

Use /admin

- New leads / call-backs
- Navbar Services links
- Staff accounts
- Lead email issues (ops)

13. What appears live — and when

- If you don't see a change: hard-refresh the page, try an Incognito window, wait for ISR, or ask tech to redeploy / purge cache.
- Wrong URL? Check **URI Path** and Redirects.

14. Troubleshooting

Problem	Likely cause	What to do
Can't sign in to Studio	Not invited / wrong account	Ask Admin to invite your email in Sanity Manage
New fields missing (e.g. Mobile hero)	Browser cache / old Studio bundle	Hard refresh; confirm schema deploy; sign out/in
Published but site unchanged	ISR cache / wrong URI	Wait / hard refresh; verify URI Path; check draft vs published
Image won't upload	Huge file / network / permissions	Compress under ~2–5 MB; retry; check Editor role
Can't publish — validation error	Missing required field (often Alt text)	Read the red error; fill Alt text / required fields
404 on service URL	URI mismatch or unpublished	Match URI to address bar; publish; add Redirect if moved
Mobile shows wrong crop	No mobile image / hotspot	Upload Mobile hero image at 1080×1350; set hotspot
Form leads not in Sanity	Expected — leads aren't CMS content	Check website <code>/admin/leads</code> and email/SMTP
Mega menu wrong links	Not edited in Studio Navigation alone	Edit <code>/admin/menu</code> → Save menu
Preview / draft link fails	Missing preview secret	Open preview from Studio Presentation only

15. Quick checklists

Before publishing a service

- ☐ Page title is correct H1
- ☐ URI Path matches final URL
- ☐ Desktop hero uploaded (1920×900)
- ☐ Mobile hero uploaded (1080×1350) if needed
- ☐ Alt text on images
- ☐ SEO title + description
- ☐ FAQs / CTAs reviewed
- ☐ Publish clicked
- ☐ Live URL checked (Incognito)

Before publishing a blog post

- ☐ Title & slug set
- ☐ Featured image + alt
- ☐ Excerpt filled
- ☐ Body headings structured
- ☐ SEO fields filled
- ☐ Publish + check /blogs/

Need help?

Content questions → clinic editor lead.

Access / Studio invite → Sanity project Administrator.

Website bugs / deploy / leads email → development team (Hostinger + Neon + SMTP).
